# Notes

- The inclusion of collateralised Brady Bonds and floating rate notes in the Emerging Markets Funds managed by DWS necessitate the use of an extended set of risk characteristics defined hereafter.
- The **Average Yield to Maturity** is the portfolio's average return based on its interest income, capital gains, or capital losses inclusive of its collateral cash flows.
- Modified duration** is the percentage price change of the portfolio for a given change in average yield. The higher the modified duration, the higher the portfolio's risk.
- Interest rate duration** is the percentage price change of the portfolio for a given change in the U.S. Treasury par curve. The higher the interest rate duration, the higher the portfolio's exposure to changes in US interest rates.
- Spread duration** is the percentage price change of the portfolio for a given change in sovereign spread, i. e. the average yield spread of the sovereign's bonds over the U.S. spot curve. Unlike interest rate duration, spread duration only changes the discount rates applied to non-collateralised cash flows. The higher the spread duration, the higher the portfolio's exposure to changes in Emerging Markets credit risk.
- The **Average Rating** is calculated excluding cash positions.
- Country Allocation** refers to country / business risk of the security, not to the country of issuance (of importance for offshore issues).
